ABSTRACT

Devender R., Ramakrishna H. & Padal S. B. 2014. Pollen diversity in *Apis* honeys of Narsipatnam Forest, Visakhapatnam District, Andhra Pradesh, India. Geophytology 44(2): 181-187.

The paper incorporates pollen analysis of five squeezed *Apis florea* honey samples collected from Narsipatnam Forest Division of Visakhapatnam District, Andhra Pradesh during 2011-2012. Of these, two honey samples are unifloral and remaining three are multifloral. *Schleichera oleosa* pollen are predominant in unifloral honey samples. The other significant pollen types are of *Mimosa pudica*, *Syzygium* sp., *Eucalyptus globulus*, *Tridax procumbens*, *Terminalia arjuna* and *Corchorus fascicularis*. These pollen types are therefore fairly reliable nectar source for honey bees in this area.

Key-words: Melissopalynology, pollen diversity, *Apis* honey, Narsipatnam Forest, Visakhapatnam District, Andhra Pradesh, India.

INTRODUCTION

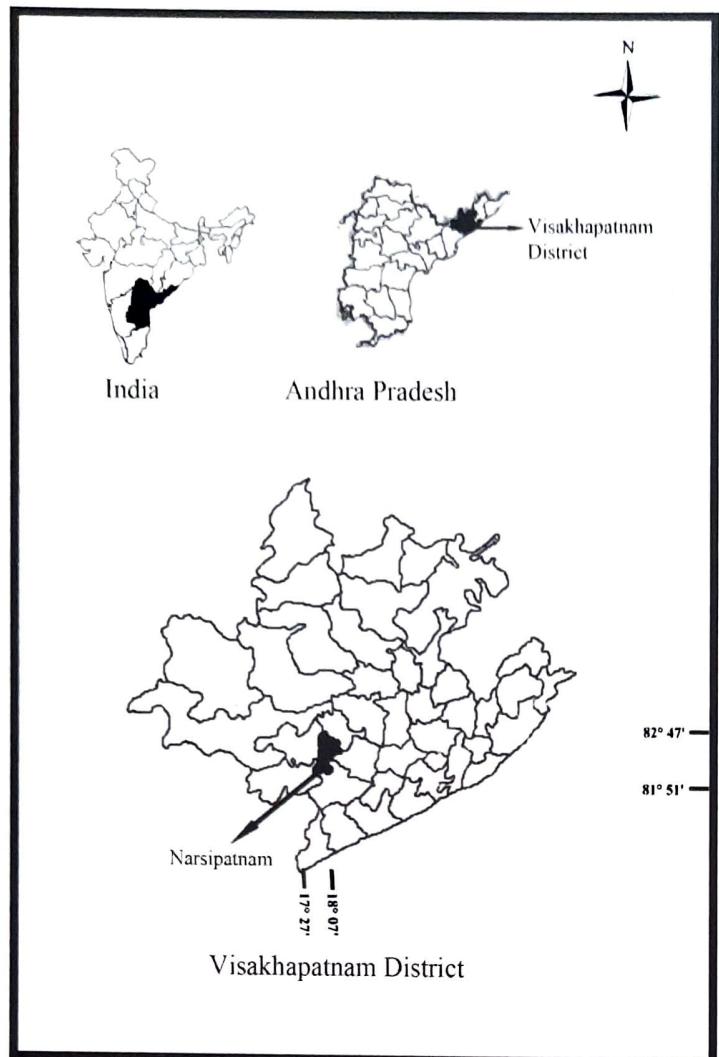

Narsipatnam Forest Division lies in the north-eastern part of Andhra Pradesh (Latitudes 17°27'33" to 18°07'02"N, Longitudes 81°51'47" to 82°47'59"E). This forest division covers an area of 3754.99 km², which is 30.95% of the area of Visakhapatnam District. The pollen characterization and quantification of honeys constitute a fairly reliable auxiliary method for recognizing the nectar source and botanical origin of honey. The study further indicates that the rich floral resources of this district may enhance the bee-keeping industry and honey production.

MATERIAL AND METHOD

Five squeezed *Apis florea* honey samples (200

ml each) were collected from Narsipatnam Forest of Visakhapatnam District, Andhra Pradesh (Text-figure 1). These were processed for pollen recovery by using Erdtman's (1960) acetolysis technique. Three slides were prepared from each sample for study and identification of pollen types. The pollen types were identified up to genus or species level with the help of prepared reference pollen slides of local flora and relevant literature.

For determining percentage of pollen types, 300 pollen specimens per sample were counted. Honeys with a predominant pollen type (>45%) were termed as unifloral and the rest as multifloral. As per Louveaux et al. (1978), four frequency classes are recognized, viz. i. predominant ($P = >45\%$); ii. secondary ($S = 16-45\%$); iii. important

Text-figure 1. Map showing the study area.

minor ($I = 3\text{-}15\%$); and iv. minor ($M = <3\%$). The pollen spectra for each honey sample were prepared on the basis of frequencies of the pollen types (Text-figures 2-6).

OBSERVATION

Altogether, five honey samples were palynologically analyzed. Of these, two honey samples are unifloral and three are multifloral. Forty-three pollen types, referable to 23 families, were recorded in these honeys. Most of the pollen types are common to all the honey samples, indicating their same geographical origin. The frequency class-wise representation of pollen types in each sample is given below.

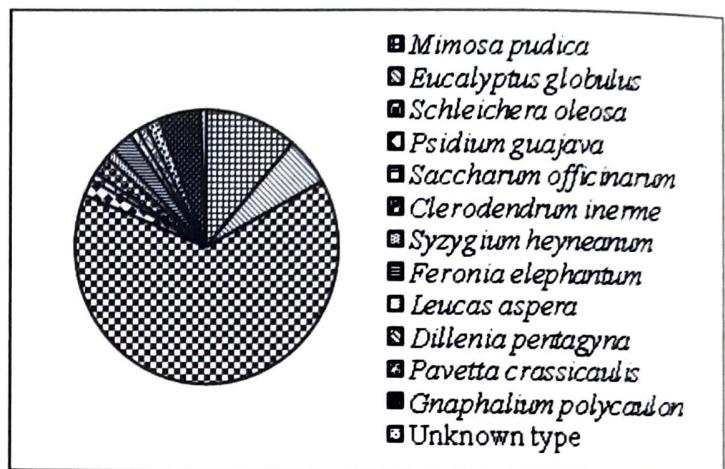

1. Sample no. V-N-AF-12, unifloral (Text-figure 2).

P: *Schleichera oleosa* (64.2%).

S: Nil.

I: *Mimosa pudica* (11.3%), *Eucalyptus globulus* (5.7%), *Gnaphalium polycaulon* (5.7%).

M: *Clerodendrum inerme* (2.2%), *Feronia elephantum* (2.7%), *Psidium guajava* (1.2%), *Saccharum officinarum* (1.0%), *Syzygium heyneanum* (1.2%), *Leucas aspera* (1.0%), *Dillenia pentagyna* (1.2%), *Pavetta crassicaulis* (1.7%) and Unknown type (0.9%).

Table 1. Family-wise pollen diversity in honey samples.

Families	Palynotaxa
Asteraceae	<i>Ageratum conyzoides</i> , <i>Centipeda minima</i> , <i>Conyza strica</i> , <i>Pulicaria foliolosa</i> , <i>Tridax procumbens</i> , <i>Guizotia abyssinica</i> , <i>Gnaphalium polycaulon</i> , <i>Sphaeranthus indicus</i> , <i>Vicoa cernua</i> , <i>Cyathocline purpurea</i>
Tiliaceae	<i>Corchorus fascicularis</i>
Acanthaceae	<i>Blepharis maderaspatensis</i>
Fabaceae	<i>Erythrina indica</i> , <i>E. suberosa</i> , <i>Bauhinia purpurea</i> , <i>Crotalaria juncea</i> , <i>Acacia chundra</i> , <i>Albizia lebbeck</i> .
Malvaceae	<i>Sida cordata</i> ,
Sapindaceae	<i>Schliechera oleosa</i> , <i>Sapindus emarginatus</i>
Loranthaceae	<i>Dendrophthoe falcate</i>
Commelinaceae	<i>Commilina suffruticosa</i>
Combretaceae	<i>Terminalia arjuna</i>
Celastraceae	<i>Celastrus paniculatus</i>
Caesalpiniaceae	<i>Cassia mimosoides</i>
Cucurbitaceae	<i>Citrullus lanatus</i>
Anacardiaceae	<i>Lannea coromandelica</i>
Verbenaceae	<i>Clerodendrum inerme</i> , <i>Lantana camera</i>
Lecythidaceae	<i>Caryea arborea</i>
Lamiaceae	<i>Leucus aspera</i> , <i>Ocimum sanctum</i>
Rutaceae	<i>Feronia elephantum</i>
Sapotaceae	<i>Manilkara zapota</i>
Dilleniaceae	<i>Dillenia pentagyna</i>
Myrtaceae	<i>Eucalyptus globulus</i> , <i>Syzygium cumini</i> , <i>S. heyneanum</i> , <i>Psidium guajava</i>
Rubiaceae	<i>Pavetta crassicularis</i>
Mimosaceae	<i>Mimosa pudica</i>
Poaceae	<i>Saccharum officinarum</i>

M: *Centipeda minima* (2.0%), *Ageratum conyzoides* (1.6%), *Blepharis maderaspatensis* (0.9%), *Ocimum sanctum* (1.7%) and *Saccharum officinarum* (0.7%).

DISCUSSION

Pollen taxa, represented in the honey samples of Narsipatnam Forest Division, belong to following 23 families: Asteraceae, Tiliaceae, Acanthaceae, Fabaceae, Malvaceae, Sapindaceae, Loranthaceae, Commelinaceae, Combretaceae, Celastraceae, Caesalpiniaceae, Cucurbitaceae, Anacardiaceae, Verbenaceae, Lecythidaceae, Lamiaceae, Rutaceae, Sapotaceae, Dilleniaceae, Myrtaceae, Rubiaceae, Mimosaceae and Poaceae (Table 1, Plates 1, 2).

Tridax procumbens, *Ageratum conyzoides*

and *Sphaeranthus indicus*, recorded in the present study, were recorded as predominant pollen types from the *A. florea* honey samples of Ranga Reddy District, Andhra Pradesh (Ramanujam & Kalpana 1990). *Tridax procumbens*, *Ageratum conyzoides*, *Ocimum basilicum*, *Vernonia cinerea*, *Celosia argentea*, *Brassica nigra*, *Cajanus cajan*, *Ricinus communis* and *Sonchus oleraceus* were dominant palynotaxa in *Apis florea* honeys from Adilabad District (Ramakrishna & Swathi 2013). *Lannea coromandalica*, *Terminalia arjuna*, *Madhuca indica*, *Lagestroemia parviflora*, *Sphaeranthus indicus* and *Opilia amentacea* were encountered in *Apis dorsata* honeys from Nizamabad District, Andhra Pradesh (Ramakrishna & Bushan 2004). *Saccharum officinarum*, *Sphaeranthus indicus*, *Eucalyptus globulus* and *Terminalia* sp. are the common pollen taxa recorded in the honey samples of both Adilabad District and of the present study (Swathi & Ramakrishna 2012). *Mimosa pudica*, *Tridax procumbens*, *Ageratum conyzoides* and *Eucalyptus globulus* pollen are common pollen types recorded from the honeys of present locality and Guntur District (Ramanujam & Khatija 1990). In the present work, *Schliechera oleosa* is the predominant pollen type which was not recorded earlier as predominant from any other locality of Andhra Pradesh. Family Asteraceae is the major source of nectar for honey bees which is followed by Fabaceae and Myrtaceae in the Narsipatnam Forest area.

This pollen diversity in *Apis* honeys, i.e. diversity of bee forage plants, clearly indicates that Narsipatnam Forest Division of Visakhapatnam District, Andhra Pradesh, is a prone area for bee-keeping ventures and useful to enhance honey production from this area.

ACKNOWLEDGEMENTS

The authors are thankful to Professor C. G. K. Ramanujam for encouragement in the preparation of this article, to local tribes for collection of samples and to the Principal, University College of Science, Saifabad for providing laboratory

facilities. The financial assistance received from University Grants Commission, RFSMS (BSR Scheme) is gratefully acknowledged.
