

PALYNOLOGICAL LITERATURE IN FRENCH

G. THANIKAIMONI

French Institute, Pondicherry

ABSTRACT

A brief account of the scientific activities of the Association of the Palynologists of French Language, and list of atlases and monographs devoted to the morphology of spores and pollen grains as well as some papers of fundamental palynology in French have been given.

INTRODUCTION

Palynology has attracted the attention of scientists all over the world. The three International Palynological Conferences held in Tucson, Utrecht and Novosibirsk as well as the efforts to hold the fourth at Lucknow in 1976 stand testimony to their sustained and active interest in this field. The productivity of the palynologists is appalling. "The average worker in pure palynology produces more papers than the average researcher in the majority of other scientific disciplines" (A. A. MANTEN; *Rev. Palaeobot. Palynol.* 6: 5-7). "Thanks to the works of first ERDTMAN and later MADAM VAN CAMPO and also MANTEN the bibliography of palynology is exceptionally well looked after" (K. FAEGRI; *Taxon*, 23: 396). HANS TRALAU has recently published a most welcome and highly useful desk top ready reckoner for the use of palynologists. His bibliography (\pm 25000 titles) and Index (\pm 59000 items) to Palaeobotany and Palynology 1950-1970 will be followed by another work covering the world literature from late medieval times up to 1940 (\pm 45000 references.) "At the current rate the proposed publication of a bibliography and index for the period 1970-1980 will include about 30000 titles" (J. R. ROWLEY: *Taxon*, 24: 386).

LANGUAGE BARRIERS: MANTEN'S STATISTICAL ANALYSIS

In 1968, MANTEN reported some very important results based on his survey of the palynological literature published between 1916 and 1965 (*Rev. Palaeobot. Palynol.*, 6: 105-109, 177-188; 7: 5-10, 73-80, 145-148, 241-247). According to him, the language distribution of the palynological publications that appeared during 1916-1965 is as follows : English 34%, Russian 22%, German $16\frac{1}{2}\%$ and French $9\frac{1}{2}\%$. There is a change in the percentage if we consider only the period 1961-1965: English 42%, Russian 21%, French 12%. Whereas from 1916 to 1940 not less than 35% of palynological papers appeared in German, this was not more than 9% in 1961-1965.

The bulk of the palynological results of the researchers in China, Japan and Russia remains locked up in their vernacular and are not available in English, French or German. A survey of the articles published in the three leading international journals, *Grana* (I-XIII), *Pollen et Spores* (I—XVI) and *Review Palaeobotany and Palynology* (I—XVIII) shows that English occupies the premier position (68%) and French the second place (25%).

Although the English speaking palynologists are in an advantageous position and even if "English strengthens its position still further as the leading scientific language" (MANTEN, *loc.cit.*) one cannot afford to ignore (ignorance is *not* bliss!) the important results already published and available only in other languages. "One of the reasons for an imperfect knowledge of published information is the existence of language barrier". If one masters English, French, German and Russian, "not less than 82% of the literature lies open for the researcher" (MANTEN, *loc.cit.*). It would be very useful if some regular English reviews of non-English publications are made available for the benefit of the English speaking palynologists.

This paper draws attention to some of the major works in French. It gives a brief account of the laudable scientific activities of the Association of the Palynologists of French Language, followed by a list of atlases and monographs devoted to the morphology of spores and pollen grains of plant taxa as well as some papers of fundamental palynology published in French. The immense palaeopalynological and other contributions made in French, not being available to us, could not be dealt here. The titles of the publications are translated into English. We hope that this introduction to French palynological literature will be instrumental to create an interest to learn French, the knowledge of which the author and his Indian colleagues find rewarding.

ASSOCIATION OF THE PALYNOLOGISTS OF FRENCH LANGUAGE (APLF)

In May 1968, MANTEN (*loc.cit.*) expressed the fear that "the future decades will presumably show also a gradual decline of French as a scientific language". Just a few months earlier, in October 1967, an important event had taken place. The Association of the Palynologists of the French Language was started. In less than a decade of its existence, this association, with over 200 members hailing from several countries has made many outstanding contributions in French. The latest research themes of APLF are given in its "annuaire" 1976. The activities of this association are organised by six working groups each with an animator :

- (1) Spore-pollen morphology and codification (B. LUGARDON).
- (2) Botanical markers in pollen analysis and ecological value (A. PONS).
- (3) Quaternary palynology (J. RENAULT-MISKOVSKY).
- (4) Neogene palynology (H. MEON-VILAIN).
- (5) Upper Cretaceous palynology (S. DURAND).
- (6) Mellissopalynology (J. LOUVEAUX).

The progress report of these working groups are periodically announced in the APLF circulars which in addition diffuse the news of the International Commission for Palynology and the various palynological associations around the world.

The activities of the working group of *Spore-pollen morphology and codification* deserve a special mention. In 1969, PH. GUINET issued a French translation of the book "Pollenmorphologiske Definitioner og Typer" by IVERSEN AND TROELS SMITH (1950). The same year M. REILLE presented an article entitled "Proposals for the analytical descriptions of the exine of spores and pollen grains". In 1972, J. GERMERAAD has presented in Paris his "Computer based numerical coding system". PH. GUINET is now preparing a code to the pollen. Four IBM cards are used for the codification. In one card, the following information is recorded: taxonomy, nomenclature, author, biological type, geographical

distribution and important botanical characters for the actual pollen grains; morphological features, age and author for the fossil pollen grains; preparation methods, mounting medium and variations due to them. The three other cards are used to record the morphological characters (indicating standard deviation of all the quantitative characters), the number of pollen grains observed and measured.

Twenty eight members of APLF have jointly prepared a pollen atlas entitled "Pollen and spores of tropical Africa". Welcoming this collective effort VAN CAMPO, in her introduction to this atlas, suggested that other scientific organisations should also follow this commendable venture of APLF.

The following are the symposia organised by the APLF. It is noteworthy that APLF takes into consideration the suggestions from its members regarding the topics and the place of the symposia:

(1) *Pollen Dispersal*—The titles of the papers presented at this symposium, held in 1971, are given below:

- The relations between the recent pollen spectra and the vegetation in Western Europe, by HEIM, J. (181 p; published by *Lab. Palynologie & Phytosociologie, Univ. Louvain*).
- Some elements of mycological aerosporology, by M. MALLEA (*Thesis Fac. Marseille*, 1968).
- Some problems of pollen dispersal in Mediterranean region, by TRIART, H. & BERNARD, J. (*Ann. Fac. Sci. Marseille*, XLIV (B) 1971).
- Palynological representation of the montane plant associations in Ethiopia. Examples of altitudinal variations, by R. BONNEFILLE (*Thesis, Univ. Paris*, 1972).
- Comparison between the pollen rain and the pollen released into the atmosphere at N. W. Sahara, by COUR, P., COHEN, J. & DUZER, D. (*Palynology in Medicine, Proc. 3rd IPC*: 41-58).

(2) *Palynology and Continental Drift*—This symposium was held at Strasbourg in October 1973 and the papers presented are published in one volume of *Sci. Geol. Bull. Strasbourg* (27: 1-193). The contents of this publication are as follows:

- SITTLER, C.—Palynology and continental drift. Introduction (p. 3-7).
- ROCHE, E.—Palaeobotany, palaeoclimatology and continental drift (p. 9-24).
- STREEL, M.—Similarities among the spore assemblages of Europe, N. Africa and N. America in the Upper Devonian (p. 25-38).
- BAR, P. & RIEGEL, W.—Palaeozoic microfloras of Ghana and their palaeofloristic relations (p. 39-58).
- TAUGOURDEAU-LANTZ, J.—Palynology and continental drift in the Triassic (p. 59-67).
- JARDINE, S., KIESER, G. & REYRE, Y.—Progressive individualisation of the African continent seen through the palynological data from the Secondary Period (p. 69-85).
- JARDINE, S., BIENS P. & DOERENKAMP, A.—*Dicheiropollis etruscus*, a characteristic pollen of the Lower Cretaceous Africa and South America; consequences for the evaluation of climatic unity and implications in the continental drift. (p. 87-100).

- HERNGREEN, G. F. W.—Middle Cretaceous palynomorphs from North Eastern Brazil: Results of a palynological study of some boreholes and comparison with Africa and the Middle East (p. 101-116)—in English.
- CERGEAU-LARRIVAL, M. Tu.—Palynology and distribution of present day austral Umbelliferae. Relationships with the Tertiary geofloras (p. 117-134).
- ROSSIGNOL-STRICK, M.—Plate tectonic and marine palynological sedimentation on the Mediterranean ridge (p. 135-145).
- LOBREAU-CALLEN, D.—Palynological problems linked with the continental drift. Study of some tropical taxa (p. 147-168).
- GUINET, Ph.—Pluricontinental areas in Mimosaceae (p. 169-184).
- HUYNH, K. L.—Use of data from the morphology of present day pollen to support the continental drift theory (p. 185-193).

All those who have read the recent works on the continental drift and the discontinuous distribution by RAVEN AND AXELROD (*Ann. Miss. Bot. Gard.*, 61: 531-673), AUBREVILLE (*Adansonia*, 14: 5-27; 145-198) and the book ‘Forest Ecosystems in Africa and South America: A comparative review’ (Smithsonian Institution Press, Washington), will find the papers presented at the APLF symposium equally interesting.

(3) *Taxa Guides in Palynology*—A symposium on this subject was held in October 1975, to focus attention on the taxa that guide to recognize a particular stratum or climate or ecology or step in the evolution of Plant Kingdom, etc. On the same occasion, there were two meetings to discuss the structure and nomenclature of spore-pollen wall (President: S. NILSSON) and Plio-Pleistocene palynology of Tropical Africa: Identification of periporate pollen grains; African Acacia and E. African Amaranthaceae (Convenor: R. BONNEFILLE). Some papers presented at the above symposium are given in the following publication: Structure and terminology of the sporepollen wall. (Ed.—C. CARATINI & C. TISSOT.—APLF, Talence, 1975; 53 p.).

The latest APLF circular (April 1976) announced that the following papers presented at the Taxa Guides symposium will be published in *Rev. Micropaléont.*

- MULLER, J. & CARATINI, C.—Palynological study of the genus Rhizophora.
- COQUEL, R., DOUBINGER, J. & LOBOZIAK, S.—The guide microspores from Westphalien to Autunien of West Europe.
- MORZADEC-KERFOURN, M. T.—The ecological significance of Dinoflagellates and their value in the study of the changes of the marine medium.
- YBERT, J. P.—Actual pollen discharges at the zone of contact between forest and savanna in Ivory Coast.
- SALARD-CHEBOLDAEFF, M.—The probable presence of Oligocene in the coastal sedimentary basin of Cameroun.
- MORAND, F. & BARTHELEMY, L.—The relations between forest clearings and three guide taxa: Beech, Ericaceae, Alnus.
- BOLTENHAGEN, E.—Senonian microflora of Gabon.
- STRAKA, H.—Pollen of *Cornus suecica*, indicator of Tundra—Park of the Late Glacial of Central Europe.
- TAUGOURDEAU, Ph.—Could the “Scolecodontes” furnish guide taxa?
- SUC, J. P.—Some taxa indicating a climatic change in the Middle Pliocene of Languedoc.

- CARO, Y.—Stratigraphic use of Dinoflagellates in the Paleogene of North Sea.
- LOBREAU CALLEN, D.—Ecological significance of pollen variations in the genus *Ilex* (Aquifoliaceae).
- ANTONESCU, E.—Some characteristic associations of Lower Trias and passage to the “Anisien” in Rumania.
- GRUAS-CAVAGNETTO, C.—The Eocene stratigraphic markers (Dinoflagellates) of Paris basin and eastern Manche.
- REYNAUD, C.—*Hippophae rhamnoides*, guide taxon in the history of Finland vegetation.
- FOUCHER, J. C.—The Dinoflagellates of the silex and the stratigraphy of the Upper Cretaceous of France.
- SCHULER, M., SITTLER, C. et al.—(Paleogene working group). Stratigraphic extension and geographical distribution of two Paleogene pollen genera observed in W. Europe: *Aglaoreidia* and *Boehlensipollis*.

SPORE-POLLEN ATLASES IN FRENCH

Twelve spore-pollen atlases published in French are listed below. Put together, they provide detailed illustrated descriptions for 1758 species.

- (1) African palynology, I-XI. (ed.) M. VAN CAMPO (1957-1971) in *Bull. I.F.A.N.*, XIX—XXII, XXVI, XXVII, XXIX—XXXIII (266 species; 238 plates).
- (2) Pollen and spores of tropical Africa. (ed.) C. CARATINI & PH. GUINET.—*A.P.L.F.* & *G.E.G.T.*, *Talence*, 283 p. (195 species).
- (3) Pollen atlas of Tchad, by J. MALEY (1970)—*Bull. Nat. Géog.* 40: 29-48; Pl. 1-25 (120 species).
- (4) Pollen atlas of Ethiopia, by R. BONNEFILLE (1971). *Adansonia*, 11: 463-518; *Pollen et Spores*, XIII: 15-72 (112 species).
- (5) Palynological studies of lowly hydrophilous plants of Ivory Coast, by GOUDET DUCELLIER, M. (1967)—*D.E.S. Univ. Dijon.* 59 p. (38 species).
- (6) Some pollen of Liban flora, by M. HADDAD (1969). *Pollen Spores*, XI: 39-63. (34 species).
- (7) Palynology of Madagascar and Mascarenes. (Ed.) H. STRAKA (1964-1969). *Ibid VI—IX, XI* (493 species).
- (8) Mediterranean and western palynology. (Ed.) M. VAN CAMPO. (1962-1969) in *Ibid IV—VII, XI* (197 species).
- (9) Pollen of honey plants of Europe. by A. MAURIZIO & J. LOUVEAUX (1960-1964). *Ibid II—VI* (62 species).
- (10) Pollen Atlas of Istanbul region, by B. AYTUG et al. (1971); Istanbul Univ. (117 species).
- (11) Pollen of tropical Asia, by PH. GUINET (1962) *Inst. Fr. Pondicherry, Trav. Sec. Sci. Tech. Tome V. Fasc. 1* (52 species).
- (12) Pollen Atlas of trees of some indigenous bushes of Quebec. by P. RICHARD (1970). *Naturaliste Canad.* 97: 1-34, 97-161, 241-306 (72 species).

SPORE-POLLEN MORPHOLOGICAL MONOGRAPHS IN FRENCH

BRYOPHYTES
